**This report describes changes to the Fund that occurred during the reporting period.**

## WHAT WERE THE FUND COSTS FOR THE PAST YEAR? (based on a hypothetical \$10,000 investment)

Class Name	Costs of a \$10,000 investment	Costs paid as a percentage of a \$10,000 investment
Class I	\$178	1.79%

## HOW DID THE FUND PERFORM LAST YEAR AND WHAT AFFECTED ITS PERFORMANCE?

The Fund saw negative performance for the one-year period ended August 31, 2024. The Fund’s Diversified Trendfollowing trading advisers were the primary source of negative performance at the trading style level.

At the market sector level, the Fund saw losses in fixed income and major currencies. Uncertainty about the timing of potential interest rate cuts by central banks was a key factor influencing these markets. This uncertainty contributed to a lack of clear price trends and several price reversals that proved challenging for some of the Fund’s underlying trading advisers. Performance across energy and metals markets was also negative.

The Fund did capture gains in agricultural commodities and equities. Strong price uptrends in cocoa were the primary source of gains within agricultural commodities. Meanwhile, long positions across equity indices also resulted in gains as global stocks reached new record highs during the period.

**WHAT DID THE FUND INVEST IN?** (as of August 31, 2024)

Market Group	Risk Allocation (% of overall Value at Risk)
Agricultural Products	7.5%
Currency	19.1%
Energy	12.8%
Equity	27.8%
Fixed Income	21.9%
Metals	10.8%

**The data shown relates to the positions held by the Fund and its wholly owned and controlled subsidiaries and does not take into account any other assets held by the Fund (primarily cash and cash-equivalents). The Fund is actively managed and percentages may vary over time.**

**Value at Risk Definition:** Value-at-Risk (VaR) expresses market risk as a percentage of a portfolio's value. The VaR figures quoted are as of August 31, 2024, based on a historic VaR calculation with a 5-year lookback period (1300 days), calculated at the 95th percentile. The historical approach to evaluating a portfolio's VaR involves applying the current positions to the historical portfolio prices of the corresponding instruments, and then calculating how the current positioning would have performed historically. For any chosen threshold value, the hypothetical returns then provide an estimate of the current VaR figure.
